HomeCU upgrades network to World Class Data Center

BOISE, ID (May 19, 2003) – Database Management Services, Inc. announced today the completion of off-site collocation. The collocation dramatically enhances the core level of availability of services while ensuring the highest level of security. The new infrastructure utilizes a high-speed fiber backbone with multiple DS3/45MB carriers using Sonet ring technology to ensure members receive the best of breed access to their home banking services. With built-in redundancy, scalability, and high bandwidth connectivity, HomeCU assures you around-the-clock reliability — critical to the ongoing success of your home banking.

“We know that Credit Unions expect HomeCU to ensure their services are always up and running. Today, we can say our availability or uptime will be a minimum of 99.999% as a result of our collocation move to a Cisco Powered Network. Less than 1% of all Internet Service Providers in the world qualify for this recognition by Cisco Systems” Joe Pearson stated.

HomeCU is the innovative home banking solution developed exclusively for credit unions and proven since 1996. Full-featured, secure, and cost-effective, HomeCU integrates easily with many different data processing systems and includes e-statements, online member surveys, a domain-based e-mail server, and many other unique features. Additional information and a live demo are available at www.homecu.com.
